MAKE YOUR LIFE CARBON NEUTRAL

POLLUTED WATER AND AIR  
AND OUR CARBON FOOTPRINTS

# Solution: Plant A Life

## BAMBOO

Bamboo have many environmental benefits because they function as carbon sinks, produce oxygen, control soil erosion, provide organic matter, regulate water levels in watersheds, conserve biodiversity, beautify the landscape, and essentially contribute to the purification and regulation of the environment.

Bamboo grows faster than any other plants on Earth

Bamboo sequesters as much as four times more carbon dioxide and releases 35% more oxygen than a similar stand of hardwood trees

Lasts 35-100 and more years, even indefinitely

Five Bheema Bamboos can absorb as much as 1,600 kg of CO<sub>2</sub>

Wake  
Up

COMPENSATE OUR CARBON FOOTPRINT

# WHAT IS EVERY INDIVIDUAL CARBON FOOTPRINT?

All of our daily activities emit greenhouse gases. food, transportation, the Air Condition of our house and office, taking a shower, watching tv, buying clothes, every single one of our lifestyle choices contributes to the production of these gases, most commonly expressed in kilos of carbon, or CO<sub>2</sub>.

This CO<sub>2</sub> is absorbed in the atmosphere and causes an increase in the temperature on Earth, also known as “global warming” , a big threat to all life on the planet.

The first step in the fight against global warming is to reduce our carbon footprint as much as possible. Next to reducing the amount of CO<sub>2</sub> we emit.

Join the revolution of compensating carbon. Trees, bamboo and oceans act as ‘carbon sinks’ , places where CO<sub>2</sub> is stored, instead of released into the atmosphere.

By planting Bamboo we directly contribute to the absorption of carbon and the fight against global warming.
